

# **CO<sub>2</sub>-2e** Temperature, Humidity & CO<sub>2</sub> Control

Custom Automated Products offers a full range of equipment for the growing enthusiasts. The  $CO_2$ -2e will control the temperature, humidity and  $CO_2$  levels within your growing area. It has 2 sequence timers for coordinating the ventilation and the  $CO_2$  enrichment. It can also be used with the PPM-1c digital  $CO_2$  sensor for PPM accuracy.

Temperature & Humidity Controlle

-2e

#### **Overview**

- The CO<sub>2</sub>-2e controls (lowers) temperature by turning on an exhaust fan or AC unit. External remote temperature probe is very reliable and it can be placed up to 30" from the unit.
- Humidity is controlled independently of temperature.
- Two indicator lights verify Exhaust or CO2 on.
- $\bullet$  Photocell ensures CO\_2 value or generator is only active during the day when the HID lights are on.
- Optional Part-Per-Million sensor (PPM-1c) can be combined with the CO<sub>2</sub>-2e for an extremely accurate method of controlling CO<sub>2</sub>.
- Two timers are used to fully coordinate CO<sub>2</sub> and Exhaust functions.
- The CO<sub>2</sub>-2e is a solid & reliable unit with a 3-year warranty!

#### INSTALLATION

There are certain steps which should be taken to ensure a successful installation of your  $CO_2$ -2e.

- **1)** Determine the desired location for the  $CO_2$ -2e. It should be at plant height and near a 120 volt power supply.
- 2) The external remote temperature probe can be uncoiled to place the probe up to 30" from the unit.
- \* NOTE: DO NOT BEND TIGHTLY OR KINK THE SILVER CAPILLARY TUBE.

**3)** Mount the  $CO_2$ -2e to a wall or other vertical surface. The photocell, which controls the day/night function of the  $CO_2$ -2e, must be facing a source of light. If the light level is too low, the  $CO_2$  function may not be activated.

4) Keep the CO<sub>2</sub>-2e far from any CO<sub>2</sub> generator or other sources of high heat to eliminate faulty temperature readings.

- 5) A 3 wire outlet must be used. Do not use 2 wire adapters or cords to operate the CO2-2e. (Maximum 15 amps @ 120 volts)
- 6) Read the rest of the manual!!! It has been designed to take you step by step to make start-up easier. You will have to make several decisions in order to utilize the CO<sub>2</sub>-2e to it's full potential.
- 7) Connect the power cord to a source of 120 volt power. \*Maximum COMBINED load = 15 amps.
- 8) Connect your CO<sub>2</sub> Regulator or Generator to the CO<sub>2</sub> Valve/Generator outlet on the left side of the CO<sub>2</sub>-2e.
- 9) Connect your Exhaust Fan or Air Conditioner to the Exhaust outlet on the right side of the CO<sub>2</sub>-2e
- 10) Set your desired temperature and humidity.
- 11) Read the rest of the instructions to determine how to set the CO<sub>2</sub> timers!
  - \* NOTE: The CO<sub>2</sub>-2e requires "free air movement" to maintain temperature and humidity accuracy. The top and bottom of the enclosure has ventilation slots to provide air-flow for the internal humistat. We recommend using an oscillating fan or similar air movement device to provide fresh air for the plants, and the sensors.

#### PRECAUTIONS

Do not expose the  $CO_2$ -2e to water. Electrical shock may occur. Do not disable the fuse or put in a fuse that is not rated for 15 amps at 120 volts. Do not kink the capillary tubing! Your temperature will not read correctly. Do not open the  $CO_2$ -2e. There are no user serviceable parts inside.

### **CONTROLS & TIMERS**

#### **MAKING CONNECTIONS**

The  $CO_2$  and Exhaust functions controlled by the  $CO_2$ -2e are accessed using two standard 120 volt receptacles mounted on the sides of the enclosure. Printed labels on the front face of the enclosure identify the receptacles. **Do not exceed 15 amps combined load.** 

We highly recommend using only 3 wire devices with a ground. Double-insulated devices are acceptable.

#### **PPM OPTION QUICK DISCONNECT**

The  $CO_2$ -2e comes standard with a very effective timed  $CO_2$  control system. However, if you want to control  $CO_2$  levels to actual Parts Per Million, it's as simple as plugging in our PPM-1c  $CO_2$  monitor / controller. Connecting the PPM-1c to the connector on the side of the enclosure automatically switches the  $CO_2$ -2e to control  $CO_2$  levels by PPM.

\*NOTE: If you are not using a PPM-1c, you must keep the jumper plug attached.

#### **TEMPERATURE CONTROLLER**

The  $CO_2$ -2e utilizes a remote-bulb thermostat with a 30" lead to control ventilation and cooling functions. This allows you to place the temperature sensor up to 30" away from the  $CO_2$ -2. The thermostat can be set to control temperature from 50 – 115° F.

The thermostat is coordinated with the  $CO_2$  control system and the exhaust receptacles to maintain a constant temperature. When the temperature rises above the set point selected on the thermostat, the  $CO_2$  system is disabled and the exhaust outlet is enabled. When the temperature level drops below the set point, the  $CO_2$  system is reactivated.

#### **HUMIDITY CONTROLLER**

The CO<sub>2</sub>-2e utilizes a dehumistat to control ventilation and humidity levels. The dehumistat can control humidity levels from 20% - 80%.

The dehumistat is coordinated with the  $CO_2$  control system and the exhaust receptacles to maintain a constant humidity. When the humidity rises above the set point selected on the dehumistat, the  $CO_2$  system is disabled and the exhaust outlet is enabled. When the humidity level drops below set point, the  $CO_2$  system is reactivated.

#### **A**DJUSTABLE **TIMERS**

The four adjustable timers on the  $CO_2$ -2e are set using the dials on the front face of the enclosure. The timer name and range of each timer is printed around the timer dials. Because the dials of the  $CO_2$ -2e are small to conserve space, the settings may have to be adjusted to an actual time setting. Use a watch or stopwatch to confirm the settings are correct. Once the timers are set, they are repeatable to +/- .5%.

For detailed information about how to set your timers, see the CO<sub>2</sub> Control section of this manual.

\*NOTE: In order for the timers to accept a new setting, the timer must either complete it's preset cycle or, power must be cycled off, then on. Follow the procedures below to set the CO<sub>2</sub> timers correctly.

# CO<sub>2</sub> Control

#### **CO<sub>2</sub> BASICS**

In order to maximize the benefits of CO<sub>2</sub> enrichment, you must first control the air temperature and humidity levels. Then and only then can you control the CO<sub>2</sub> level. The CO<sub>2</sub>-2e has the right tools for the job.

Carbon Dioxide is present in relatively low quantities (about 350 ppm) in your normal everyday air. But plant growth can be increased and accelerated if the level of CO<sub>2</sub> is increased to 1000-1500 ppm. For this reason, we designed the CO<sub>2</sub>-2.

The  $CO_2$ -2e  $CO_2$  control system was designed to be used for both compressed  $CO_2$  cylinders, and  $CO_2$  generators. The  $CO_2$  receptacle is 120 volts. It can run any load up to 15 amps. Compressed  $CO_2$  cylinders require an approved regulator / flow gauge and a valve.

If optimum CO<sub>2</sub> "mileage" is desired, a self contained air conditioner or other "Closed loop" cooling method is recommended. A closed loop system will regulate temperatures within the zone allowing you to extend the CO<sub>2</sub> maximum cycle time thus reducing CO<sub>2</sub> use dramatically.

Another method of reducing heat build up includes utilizing "Air-Cooled Lighting Reflectors". Just be sure to make the ventilation system of the hood as airtight as possible so that your CO<sub>2</sub> is not being drawn out of the area by the ventilated hood exhaust fan.

If sufficient CO<sub>2</sub> is used and the proper level of nutrients and light is available, a 35% increase in growth rate is possible. Each application is different, so there is some work involved in finding the optimum set-up.

## **CO<sub>2</sub> CONTROL MODES**

The CO<sub>2</sub>-2e provides both a standard timed CO<sub>2</sub> mode and an *optional* integrated CO<sub>2</sub> PPM control mode. The optional PPM-1c controller is the most precise and efficient method of distributing CO<sub>2</sub>.

\*NOTE: If the PPM-1c is not being used, the jumper-plug supplied with the CO<sub>2</sub>-2e must be plugged into the Quick Disconnect on the lower left side of the enclosure in order for the CO<sub>2</sub>-2e to function correctly.

#### TIMED CO<sub>2</sub> CONTROL MODE

The CO<sub>2</sub>-2e uses 2 timers for exhaust and CO<sub>2</sub> control. The two timers are the **CO<sub>2</sub> Inject Duration**, and the **CO<sub>2</sub> Inject Frequency**.

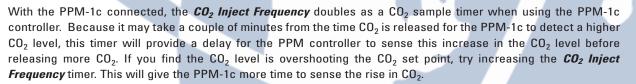

The **CO**<sub>2</sub> **Inject Duration** can be set from 1 second to 40 minutes. When the CO<sub>2</sub>-2 is powered up, the CO<sub>2</sub> cycle begins if the photocell determines that it is daytime. The CO<sub>2</sub> outlet is energized for the time set using the CO<sub>2</sub> Inject Duration timer.

The **CO**<sub>2</sub> **Inject Frequency** works in conjunction with the CO<sub>2</sub> Inject Duration timer. This timer can be set from 1 minute to 8 hours. During the CO<sub>2</sub> cycle, the CO<sub>2</sub> outlet will be turned off for the amount of time set on this timer. The CO<sub>2</sub> Inject Duration timer and the CO<sub>2</sub> Inject Frequency timer continue to recycle until the temperature or humidity exceeds the setting and then the CO<sub>2</sub> is disabled and the exhaust outlet is activated.

#### PPM CO<sub>2</sub> Control Mode (Optional with PPM-1c CO<sub>2</sub> Monitor)

The CO<sub>2</sub>-2e can control CO<sub>2</sub> levels within the growing area with parts per million (PPM) accuracy when used in conjunction with the PPM-1c controller. Simply removing the jumper plug and connect the PPM-1c into the quick disconnect on the bottom of the CO<sub>2</sub>-2e. This gives you the ability to fully control CO<sub>2</sub> with PPM accuracy. Just set the PPM level on the PPM-1c that you wish to maintain, and the CO<sub>2</sub>-2e in conjunction with the PPM-1c will coordinate your CO<sub>2</sub> and ventilation.

The PPM-1c controller consists of an infrared detector capable of measuring  $CO_2$  levels from 0 to 5000 PPM. When it is connected, it will enter a warm-up mode. The warm-up may take up to 10 minutes to complete depending on the ambient air temperature. During this time, the digital readout may be fluctuating, this is normal. When the digital readout stabilizes, a level between 250 to 650 should be displayed. Be careful however, simply breathing on the PPM-1c controller will greatly increase the  $CO_2$  level in the air resulting in a higher reading.

\*NOTE: Do not start a CO<sub>2</sub> cycle until the PPM-1 has completed the "warm-up" and the display has stabilized.

\*NOTE: Failure to follow these instructions may result in unexpected operation.

PPM-1C

#### TROUBLESHOOTING

If you are having problems with this unit, refer to these troubleshooting hints.

use or main power. Check the main power plug and replace the fuse if required with a rated fuse. Is blows repeatedly, verify that the devices connected to the unit are working properly t they do not exceed a combined 15 amps. If your devices exceed 15 amps, you may need an expansion module (UPM, HPR or MLC) hat the devices connected to the unit are working properly. Check for short circuits by g devices into a wall outlet and checking for proper operation. If your area or too small of an exhaust fan. Reduce the urces or increase your fan size. Ied lighting may solve the problem. Heat from lighting is the number one problem with growing. The jumper in the CO <sub>2</sub> PPM Sensor is connected.
t they do not exceed a combined 15 amps. If your devices exceed 15 amps, you may need an expansion module (UPM, HPR or MLC) hat the devices connected to the unit are working properly. Check for short circuits by g devices into a wall outlet and checking for proper operation. y have too much heat building up in your area or too small of an exhaust fan. Reduce the urces or increase your fan size. led lighting may solve the problem. Heat from lighting is the number one problem with growing.
g devices into a wall outlet and checking for proper operation. y have too much heat building up in your area or too small of an exhaust fan. Reduce the urces or increase your fan size. led lighting may solve the problem. Heat from lighting is the number one problem with growing.
urces or increase your fan size. led lighting may solve the problem. Heat from lighting is the number one problem with growing.
growing.
ne jumper in the CO <sub>2</sub> PPM Sensor is connected.
khaust outlet is ON, the $\mathrm{CO}_2$ will not be allowed to run. Turn up the Temperature and/or y to a higher setting.
he function of the photocell by shining a flashlight on it. If the Exhaust is OFF se may be a faulty photocell.
y have too much heat building up in your area or too small of an exhaust fan. Reduce the urces or increase your fan size.
y also consider using a "closed-loop" air conditioner to keep the temperature and humidity he set points so that CO <sub>2</sub> is allowed to run for longer amounts of time.
ure your area is sealed. You may want to install a motorized damper to seal your exhaust nen they are OFF. Even though the CO <sub>2</sub> -2e operates a standard "timed-release" sequence, y still be wasting CO <sub>2</sub> .
re operating compressed $\rm CO_2$ valves, consider purchasing the optional PPM-1c "Part-Per- ' sensor to upgrade to PPM control. The PPM-1c offers a significant improvement in $\rm CO_2$ cy.
using the PPM-1c, the CO <sub>2</sub> timers still control the duration of the "ON" and "OFF" time of valve or generator. Small areas need less "Inject Duration" time than do larger areas. areas need more "Inject Frequency" time in order to give the CO <sub>2</sub> time to "mix" properly a ambient air and measured by the PPM sensor.
th lower CO <sub>2</sub> timer settings for small areas and increase the timer settings for larger ones.

#### WARRANTY

The CO<sub>2</sub>-2e is warranted against defects in workmanship and parts for Three Years.
